

Vibration Guidelines — Demonstration Reference

Scope

This is a synthetic reference document created only for the APEX-AI prototype knowledge base.

Demonstration Threshold

The prototype uses 7.1 mm/s RMS as the review threshold for Pump P-101.

Interpretation

A measured value above the demonstration threshold should trigger engineering/maintenance review. The threshold is not presented as a universal industrial standard.

Example

Observed vibration: 8.2 mm/s RMS.

Threshold: 7.1 mm/s RMS.

Comparison: $8.2 > 7.1$, therefore the demonstration rule is triggered.

Important Limitation

Actual industrial acceptance limits depend on equipment type, operating condition, measurement method, manufacturer requirements, and applicable standards. This synthetic document is not a substitute for those requirements.
